

this is how externally another array could be accessed inside a map

javascript

 Copy code

```
const array1 = [1, 2, 3];
const array2 = [4, 5, 6];

const result = array1.map((element, index) => {
  // You can use array2 here, which is defined in the outer scope
  const correspondingValue = array2[index];
  return element + correspondingValue;
});

console.log(result); // [5, 7, 9]
```
